IMPLANTABLE CARDIAC STIMULATION DEVICE INCLUDING AN OUTPUT CIRCUIT THAT PROVIDES ARBITRARILY SHAPED DEFIBRILLATION WAVEFORMS

Abstract of the Disclosure

An output circuit for use in an implantable cardiac defibrillation provides an output pulse having a waveform of virtually any desired shape. The device includes a sensing circuit that senses cardiac activity. An arrhythmia detector detects fibrillation responsive to the cardiac activity signal. The device further includes an output circuit that provides a stimulation output pulse when the arrhythmia detector detects a cardiac arrhythmia. The output circuit includes an H-bridge having a pair of switching devices which control the output pulse waveform with pulsewidth modulation and a second pair of switching devices that control the output pulse polarity.
